### Level gauge Senso4s for gas cylinders

with app for smartphones and tablets

It's a question that's as old as the gas cylinder itself: How much gas is left inside and how much longer will it last? This question is certain to accompany the gas cylinder for many years to come, but with a new product an exact answer can finally be provided to it.

The Senso4s measures the current filling level and provides a consumption forecast in the accompanying app. How it works:

- Download the Senso4s-app (for Android and iOS) on your smartphone or tablet
- Connect the app and Senso4s via Bluetooth
- Enter parameters such as filling weight and tare weight
- Position the Senso4s on a flat surface and place the gas cylinder together with its system components such as pressure regulator, hose, etc. on top of it
- The Senso4s-app displays the current filling level with a measuring accuracy of  $\pm 1\%$
- The app will determine a long term forecast of gas consumption starting from the second measurement

#### Important notice:

- To ensure an error-free measurement, the Senso4s must be placed on a flat and firm surface
- Senso4s is suitable for all common gas cylinders with a filling weight of e.g. 5, 8, and 11 kg
- Using the app, the user can monitor the filling level of several gas cylinders with the same or different filling weight
- You can download the Senso4s-app for the respective operating system in the Apple App Store or the Google Play Store at no cost
- Supply voltage: 3 x type AAA batteries (not included in the scope of delivery)
